SUBCELLULAR LOCATION: TYPE II MEMBRANE PROTEIN (POTENTIAL).
TISSUE SPECIFICITY: BONE.
SIMILARITY: BELONGS TO PEPTIDASE FAMILY M13 (ZINC METALLOPROTEASE); ALSO KNOWN AS THE NEPRILYSIN SUBFAMILY.
                                                                                                                             Similarity

-!- FUNCTION: GOOD CANDIDATE FOR AN INDUCING FACTOR WITH POSSIBLE ROLES BOTH IN MESODERM INDUCTION AT THE BLASTULA STAGE AND IN THE FORMATION OF THE ANTEROPOSTERIOR AXIS AT THE GASTRULA STAGE.
-!- SUBCELLULAR LOCATION: SECRETED (PROBABLE).
-!- SIMILARITY: BELONGS TO THE HEPARIN-BINDING GROWTH FACTORS FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          EMBL; X62593; CAA44479.1; -. The protein has homology to the 185 amino acid protein encoded by the EHV-1 gene 3 ORF. The DNA fragment was isolated from HVT spiral FC126 (J. Gen. Virol., 70:1789-1804 (1989)) and is used as a basis for generating live recombinant viral vaccines using the herpes virus DNA sequences as vectors. The fragment contains 3 intergenic regions into which genes encoding heterologous proteins to be expressed can be inserted, preferably under control of the cytomegalovirus immediate early (CMV-IE) promoter. The heterologous proteins can be used to vaccinate poultry against Gumboro disease (caused by IBDV), Newcastle disease, Marek's disease, infectious bronchitis, infectious laryngotracheitis and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             synthase (aroA) open reading frame (ORF). The aroA product converts shikimate-3-phosphate to 5-enolpyruvoylshikimate-3-phosphate. Inhibition of this reaction prevents the synthesis of aromatic amino acids, p-aminobenzoate acid (a precursor of folate) and ubiquinone. The polypeptides or their variants are useful for assessing aroA expression and genetic variation, the creation of a vaccine and the diagnosis and treatment of bacterial infection, especially S. pneumoniae and the diseases otitis media, conjunctivitis, pneumonia, bacteremia, sinusitis
                                                                                                                                                                                                                                                                                                                                                         Streptococcus pneumoniae; aroA; antimicrobial; antik diagnosis; detection.

The present sequence is 5-enolpyruvylshikimate-3-phosphate synthase (aroA) isolated from Streptococcus pneumoniae. AroA polynucleotides and protein may be used in the diagnosis, prevention and treatment of diseases associated with the expression of aroA. For example, the polynucleotide and aroA proteins may be used to treat disorders associated with decreased aroA expression. AroA polynucleotides may be administered to treat diseases by rectifying mutations or deletions in a patient's genome that affect the activity of aroA by expressing inactive proteins or to supplement the patients own production of aroA proteins.

They may also be used to study the expression and function of aroA proteins and their role in cellular metabolism. The aroA proteins may then be used as antigens in the production of antibodies against aroA and in assays to identify medulators (agonists and antagonists) of aroA expression and activity. The anti-aroA antibodies and aroA antagonists may also be used to down regulate aroA expression and activity. They may be used in this way to treat diseases caused by Streptococcus pneumoniae. The anti-aroA antibodies may also be used as diagnostic agents for detecting the presence of aroA polypeptides in samples (e.g. by enzyme linked
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  5-enolpyruvylshikimate-3-phosphate synthase; aroA; aromatic amino acid synthesis; vaccine; bacterial infection; otitis media; conjunctivitis; pneumonia; bacteremia; sinusitis;
The present sequence represents a 5-enolpyruvylshikimate-3-phosphate synthase designated aroA. The aroA product converts shikimate-3-phosphate to 5-enolpyruvoylshikimate-3-phosphate. Inhibition of this reaction prevents the synthesis of aromatic amino acids, p-aminobenzoate acid (a precursor of folate) and ubiquinone. The polypeptides or their variants are useful for assessing aroA expression and genetic variation, the creation of a vaccine and the diagnosis and treatment of bacterial infection, especially S. pneumoniae and the diseases otitis media,
                                                                                                                                                                                       New polynucleotides and polypeptides of the S-enolpyruvylshikimate-3-phosphate synthase family the creation of a vaccine against, and diagnosis at Streptococcal infection, especially in meningitis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          S
 (aroā) isolated from Streptococcus pneumoniae. Aroa polynucleotides and control of aroa polynucleotides and control of aroa polynucleotide and aroa proteins may be used to treat disorders control of aroa proteins may be used to treat disorders control of aroa proteins may be used to treat disorders control of aroa proteins may be used to treat disorders be control of aroa proteins aroa proteins or deletions in a control of aroa proteins or to supplement the patients own production of aroa proteins. Conversely, antisense nucleic acid molecules may be administered to down conversely, antisense nucleic acid molecules may be administered to down conversely, antisense nucleic acid molecules may be administered to down conversely, antisense nucleic acid molecules may be administered to down conversely, antisense nucleic acid molecules may be administered to down conversely, antisense nucleic acid molecules may be administered to down conversely, antisense nucleic acid molecules may be administered to down conversely, antisense nucleic acid molecules may be administered to down conversely, antisense nucleic acid molecules may be administered to down conversely, antisense nucleic acid molecules may be administered to down conversely antisense and function of aroa proteins and their role in cellular metabolism. The aroa proteins may then be used as antigens in the converse of a milbodies and antisense and aroa antisense in the converse of a milbodies and antisense of aroa proteins and antisense of a molecules may also be used to down converse of antibodies and activity. They may liso be used to down converse of antised by Streptococcus pneumoniae. The anti-aroa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SSSS
                                                                                   This sequence represents a truncated tobacco mosaic virus (TMV) completed by a frame shift my fement protein. This sequence is produced by a frame shift in the produced to the 30 end of both strands of a HindIII site at viral position of a BamHI/KpnI fragment of TMV. The nucleotides AGCT are interoduced to the 30 end of both strands of a HindIII site at viral position of This leads to the production of an in-frame stop codds causing production of the 64 residue protein, rather than the wind type 267 amino acid protein. The resulting protein is non-functional and viruses containing it cannot spread from one plant functional and viruses containing it cannot spread from one plant could be used in the method of the invention for the overproduction of meterologous proteins. The method is esp. used for the production of peptides which cause an antigenic response in mammals, partic. for use in viral vaccines, for for generating a contraceptive immune response. The infectious clones may encode coat proteins for other plant viruses, or proteins conferring protection against insects and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

infection;

Adenovirus; adenoviral; Ad; fibre knob; fibre protein; gene therapy; Human adenovirus type 15 fibre knob protein sequence SEQ ID NO:11.

Recombinant fiber protein used for creating vectors for delivering desired gene to a cell with minimal ectopic infection, comprises an amino terminus of an adenoviral fiber protein and a trimerization

an

```
The present invention describes a recombinant fibre protein (I) comprising an amino terminus of an adenoviral fibre protein and a trimerisation domain. The trimerisation domain comprises: (a) an adenoviral fibre knob domain having a mutation affecting at least one amino acid residue within the region corresponding to the AB loop, B sheet, DE loop or FG loop of the wild-type adenovirus (Ad) 5 fibre

                                                                                                                                                                                                        A transcriptional vector comprises in a 5'-3' direction (1) a 5' non-transcribed region of tobamovirus, (11) a replicative enzyme of tobamovirus, (11) a foreign gene connecting region, and (1v) a 3' non-transcribed region of tobamovirus. The vector also has a transcriptional promoter region upstream of the tobamovirus region and a transcriptional terminator region downstream of the tobamovirus region, neither of which is recognised by the host cell, a replication initiation site which functions in the host cell, and a selective marker gene. This sequence is the tobamovirus movement (sic) protein and the sequence is the tobamovirus construct (See Q71546) which in turn was used in the constructional vectors pL5013 and pL5020.

                                                                                                                                                                                                                                                                                                                                                                                                A chimeric cucumber mosaic virus RNA-3 (given in Q76108) has the coat protein gene replaced by a gene encoding an elicitor, TOMV P30, having the sequence given in R67755. The construct elicits a minus-sense RNA that interacts with the RNA-dependent RNA-polymerase of an invading virus, thus conferring virus-resistance on a host plant, e.g. tobacco, tomato.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA constructs for imparting pathogen, esp. virus, resistance to plants - encodes RNA that interacts with viral RNA polymerase to generate an eliciting agent.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence appears in the specification, which describes a CC plant transformation system which comprises a replicon and a helper CC virus. The replicon comprises a tobamovirus replication origin, at least CC virus. The replicon comprises a tobamovirus protein and a gene encoding a non-tobamovirus gene encoding a non-tobamovirus protein and a gene CC tobamovirus replicase. The helper virus is a tobamovirus that has a gene concoding a tobamovirus replicase but lacks a functional gene encoding the concoding a tobamovirus replicase but lacks a functional gene encoding the composition of the protein protein. DNA encoding the replicon is integrated as CC a transgene into a chromosome of a tobamovirus susceptible plant cell. The plant transformation system is useful for producing the con-tobamovirus protein by integrating the replicon DNA into a chromosome CC of a plant cell and infecting the plant cell with the helper virus so that the protein is expressed and accumulates in the plant cell. The protein produced can be a regulatory enzyme or a structural, regulatory or therapeutic protein, e.g. an interleukin or colony-stimulating factor.

Y68642-70 represent the amino acid sequences of the fiber proteins of Adenovirus serotypes 8, 9, 13, 14, 20, 23, 24, 25, 27, 28, 29, 30, 32, 33, 34, 35, 36, 37, 38, 39, 42, 43, 44, 45, 46, 47, 48, 49 and 51. The proteins are used in the course of the invention to construct chimaeric adenoviruses with reduced antigenicity. The chimaeric adenoviruses comprise at least part of a fiber protein of an adenovirus serotype providing the chimaeric virus with a desired host range and at least part of a penton or hexon protein from another, less antigenic, serotype. The chimaeric adenoviruses are useful for gene therapy, especially where repeated delivery is required. Adenoviruses of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ş
                          CC of Adenovirus serotypes 8, 9, 13, 14, 20, 23, 24, 25, 27, 28, 29, 30, CC of Adenovirus serotypes 8, 9, 13, 14, 20, 23, 24, 25, 27, 28, 29, 30, CC 32, 33, 34, 35, 36, 37, 38, 39, 42, 43, 44, 45, 46, 47, 48, 49 and 51. CC The proteins are used in the course of the invention to construct continues comprise at least part of a fiber protein of an adenovirus denoviruses comprise at least part of a fiber protein of an adenovirus construct part of a penton or hexon protein from another, less antigenic, CC serotype providing the chimaeric virus with a desired host range and at CC least part of a penton or hexon protein from another, less antigenic, CC serotype. The chimaeric adenoviruses are useful for gene therapy, CC especially where repeated delivery is required. Adenoviruses of the invention are useful can be constructed to have a desired host range and CC a diminished capability to raise neutralizing antibodies, an absence of, CC or decreased infection of, antigen presenting cells of the immune system CC (e.g. macrophages), and an ability to escape trapping in the liver or through increased target cell specificity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

Title: Perfect score: Sequence: US-09-051-034A-13 29 MVVKGK 6

Scoring table: BLOSUM62 Gapop 10.0 ,

182106 seqs, 63460219 residues Gapext 0.5

Searched:

Total number of hits satisfying chosen parameters:

182106

Minimum DB seq length: 0
Maximum DB seq length: 200000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

Database PIR_65:* pir1: * pir3: * pir4: *

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.

A; Title: Nucleotide sequence analysis of the movement genes of resist A; Reference number: JQ1456; MUID:92113565
A; Reference number: JQ1457
A; Recession: JQ1457
A; Rolecule type: genomic RNA
A; Residues: 1-264 <CAL>
A; Residues: 1-264 <CAL>
A; Note: the authors translated the codon TGG for residue 68 as Cys C; Comment: This protein is involved in cell-to-cell transport of the C; Superfamily: tobravirus 30K protein
C; Keywords: DNA binding; transport protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A; Molecule type: genomic RNA
